Date:

30 May 2026

1. Executive Summary

The report also identified significant category overlap and duplication problems. Similar products and services are repeatedly placed across multiple sections, creating confusion in navigation and product discovery. Examples include repeated listings of Mobile, Tablets, Smart Watches, Sports Kits, and Accessories under multiple unrelated categories. The current category structure appears broad but lacks proper taxonomy management and product mapping consistency.

Search and navigation analysis revealed that users may face difficulty locating products or services efficiently. Although app performance and loading speed are generally smooth, the platform currently lacks advanced filtering systems such as ratings, nearest vendor, pricing, availability, specialization, and category refinement. First-time user experience may become confusing due to excessive category variety and unclear navigation flow.

Competitor analysis against platforms such as Amazon, Flipkart, Meesho, IndiaMART, and PolicyBazaar highlighted several missing modern marketplace features, including:

- Vendor verification systems
- Ratings and reviews
- Booking and appointment systems
- Inquiry/chat functionality
- AI-based recommendations
- Personalized suggestions
- Real-time availability indicators
- Advanced filters and sorting systems

The analysis also identified that the platform has a strong opportunity to position itself as a local service and marketplace ecosystem by improving vendor onboarding, strengthening operational coverage, simplifying navigation, and introducing modern marketplace engagement features.

Kandivali location-based testing further confirmed that vendor availability varies significantly across categories. Clothing sections showed relatively stronger vendor presence, while Grocery, Specialist Healthcare, and several Electronics sections showed limited or no operational vendors despite category visibility.

Overall, Hello has strong long-term marketplace potential due to its broad service ecosystem and local business focus. However, improvements in vendor expansion, category organization, search optimization, trust-building systems, and user engagement features are necessary to improve competitiveness, usability, and customer retention.

2. Objective of Analysis

The primary objective of this analysis was to evaluate the overall functionality, usability, and performance of the Hello application as a multi-category marketplace platform. The study aimed to understand how effectively the application supports shopping and service-based interactions within a unified system.

The analysis focused on assessing both Shopping and Services modules to identify gaps in category structure, vendor availability, and user interaction flow. It also aimed to evaluate how easily users can discover products and services through the existing navigation and search systems.

Another key objective was to identify usability issues and operational challenges affecting the marketplace experience, including empty categories, inconsistent service availability, and missing functional components such as advanced filtering, booking systems, and service workflows.

Additionally, the study evaluated vendor availability across different categories to understand the platform's operational readiness and service coverage depth.

Location-based testing (Kandivali region) was conducted to analyze how service availability varies across geographic areas and whether the platform provides consistent user experience across locations.

Finally, the analysis included a competitor comparison to benchmark Hello against leading marketplace platforms, identifying feature gaps and opportunities for improvement, followed by structured recommendations to enhance overall platform performance, scalability, and user experience.

3. Methodology

The analysis was conducted using a structured, multi-step approach to ensure comprehensive evaluation of the Hello application from both functional and user experience perspectives.

The primary method involved direct **application testing**, where different sections of the app were explored in real-time to assess usability, performance, and navigation flow. This included testing both Shopping and Service categories to understand content availability and structural consistency.

Shopping category testing was performed to evaluate vendor distribution, product availability, category organization, and filtering systems. Similarly, **service category testing** focused on healthcare, legal, insurance, and professional services to identify gaps in vendor presence and service functionality.

Search functionality testing was conducted to assess how efficiently users can discover relevant products and services and to identify limitations in search visibility and accuracy.

Navigation and UI/UX analysis was carried out to examine user flow, category hierarchy, and ease of access across different sections of the platform.

A **Kandivali location-based test** was also performed to evaluate how service availability changes with geographic filtering and to identify inconsistencies in local service distribution.

In addition, a **competitor comparison analysis** was conducted by benchmarking Hello against established platforms to identify missing features and industry gaps.

The findings were supported by **team observation reports and screenshot-based documentation**, ensuring that all identified issues were backed by practical evidence collected during testing.

4. Home Page Analysis

A) Overview

The Home Page Analysis focused on category visibility, navigation flow, product discovery, search accessibility, UI organization, and overall first-time user experience. The testing identified that the application contains a large variety of shopping and service categories, which creates broad marketplace coverage but may also make navigation confusing for users.

While the homepage is visually organized and category-rich, several usability issues were observed, including search visibility challenges, excessive category expansion, inconsistent navigation flow, and difficulty identifying active vendor sections. The analysis also identified that first-time users may experience confusion while locating products or services efficiently due to overlapping categories and limited filtering options.

B) Homepage Findings Table

<u>Module</u>	<u>Section</u>	<u>Observation</u>	<u>Impact</u>	<u>Recommendation</u>	<u>Priority</u>
Home Page	Navigation	Homepage contains too many categories, making navigation confusing	Users may struggle to quickly locate desired products/services	Simplify homepage structure and prioritize major categories	High
Home Page	Search Visibility	Search functionality is not prominently visible	Users may spend extra time searching manually	Add fixed search bar on homepage	High
Home Page	Product Discovery	No Trending Products section available	Reduced product discovery and engagement	Add Trending Products section	Medium
Home Page	Navigation	No bottom navigation menu available	Navigation requires additional clicks	Add Home, Categories, Cart, Orders, and Profile navigation	Medium
Home Page	Category Visibility	Large number of categories are displayed at once	Users may feel overwhelmed during first-time usage	Prioritize popular or active categories first	High

Home Page	Product Discovery	Users must navigate multiple sections before identifying available vendors	Increased clicks reduce browsing efficiency	Display vendor availability indicators directly on homepage	High
Home Page	User Experience	Similar or overlapping categories create confusion during navigation	Users may struggle to identify correct product/service sections	Simplify category structure and reduce duplication	High

C) Homepage Screenshots

Figure 1: Homepage displaying multiple categories and mixed content sections, creating navigation complexity for users.

Figure 2: Services section contains a large number of service categories, increasing browsing complexity.

D) Major Homepage Issues

Count vs Issue

Figure : The homepage currently contains navigation complexity, repeated sections, and overloaded category structures. These issues may affect first-time user experience and browsing efficiency.

5. Registration & Login Analysis

A) Overview

The Registration and Login Analysis focused on onboarding experience, ease of form completion, accessibility, OTP verification, and overall usability. The login process is smooth and user-friendly with no major delays or bugs observed during testing.

The registration process is simple and contains limited steps; however, certain usability challenges may arise for elderly or less technically experienced users, particularly while entering Date of Birth through the scrolling calendar system. The onboarding experience can be improved further by introducing more accessible input methods and faster sign-up options.

B) Registration & Login Findings Table

<u>Module</u>	<u>Observation</u>	<u>Impact</u>	<u>Recommendation</u>	<u>Priority</u>
Registration	DOB selection through scrolling calendar may be difficult for elderly users	Registration process becomes less accessible	Add manual DOB entry option along with calendar selection	Medium
Registration	Google/social sign-up options are not available	Manual registration increases onboarding effort	Add Google/social login options	Medium
Registration	OTP verification process works smoothly	Positive onboarding experience	Maintain current OTP performance	Low
Registration	Registration process contains limited steps and no unnecessary forms	Faster onboarding improves usability	Maintain simplified onboarding flow	Low
Login	Login section works smoothly without bugs or delays	Positive user experience	Continue maintaining performance stability	Low

C) Login and Registration Screenshot

6. Shopping Analysis

A) Overview

The Shopping Category Analysis focused on vendor availability, category organization, product discovery, navigation flow, and marketplace usability across multiple shopping sections within the Hello application. The analysis identified uneven vendor distribution across categories, where Clothing and Cake & Bakery show relatively better availability, while Grocery, Electronics, Beauty, and several other categories have limited or no operational vendors.

The testing also revealed multiple usability and structural issues including duplicate product categories, overlapping category structures, inconsistent product placement, weak navigation flow, and limited filtering functionality.

Additionally, chart analysis shows that approximately 69% of subcategories have no vendors, indicating a major gap in marketplace coverage. Vendor distribution is highly uneven, with certain categories like Paint Store having higher activity while several essential categories such as Furniture, Grocery, and Electronics show little or no operational vendors.

B) Vendor Availability Findings Table

<u>Category</u>	<u>Vendor Availability</u>	<u>Observation</u>	<u>Priority</u>
Clothing	6–10 vendors	Better vendor coverage compared to other categories	Medium
Grocery	No vendors available	Essential category currently lacks operational vendor support	High
Electronics	No vendors available	Large category listing exists without active vendors	High
Cake & Bakery	Limited vendors available	Limited product variety observed	Medium
Mobile & Accessories	No vendors available	Multiple subcategories available but no operational vendors found	High
Overall Shopping Categories	~31% active, ~69% no vendors	Vendor distribution is highly uneven across categories, with only a few active sections while ~69% of subcategories show no vendor presence, indicating major marketplace gaps.	High

C) Structural Issues Table

<u>Observation</u>	<u>Impact</u>	<u>Recommendation</u>	<u>Priority</u>
Electrical Store and Electric & Hardware Store contain overlapping products	User confusion during navigation	Separate Electronics, Electrical, and Hardware categories	High
Duplicate product listings found across categories	Reduced category clarity	Remove duplicate listings	Medium
Hardware items placed under Electrical categories	Incorrect product discovery	Move products into proper hardware categories	High
Store types and product categories are mixed together	Navigation becomes less organized	Separate store-based and product-based categories	Medium
Sportswear missing from Mens Wear	Missing expected product variety	Add sportswear subcategory	Low
Dashboard and matrix visualizations confirm overlapping category structures and inconsistent product classification across multiple shopping sections.	Causes confusion in navigation, reduces category clarity, and negatively impacts product discoverability.	Standardize category structure and ensure consistent product classification across all shopping sections.	High

D) Product Discovery Issues

<u>Observation</u>	<u>Impact</u>	<u>Recommendation</u>	<u>Priority</u>
Filtering system requires better visibility and category refinement	Product search may still feel difficult for users	Improve filter accessibility and add refined subcategory options	Medium
Many categories contain empty pages	Reduced user trust and engagement	Hide inactive categories or onboard more vendors	High

Chart analysis shows that empty categories and missing vendors significantly reduce product discovery efficiency, leading to frequent dead-end navigation and incomplete browsing experience.

Users face broken navigation flow, reduced trust, and difficulty in finding relevant products, leading to lower engagement.

Remove or hide empty categories, and improve vendor onboarding to ensure active listings across all major categories.

High

(11) Coverage Gap Analysis

(12) Improvement Suggestions Dashboard

G) Shopping Analysis Conclusion

The shopping marketplace provides broad category coverage and a structured interface; however, it currently faces significant operational and usability challenges that affect overall performance. The analysis identified low vendor availability across multiple categories, along with duplicate and overlapping category structures that reduce clarity and consistency within the platform.

Chart-based evaluation further highlights that a large proportion of subcategories remain inactive or have no vendor presence, leading to frequent empty category pages and incomplete browsing experiences. This directly impacts product discovery efficiency and reduces user engagement, as users are unable to consistently find relevant products across all sections.

Additionally, navigation issues and weak filtering mechanisms further contribute to a less efficient user journey, making it difficult for users to move smoothly between categories and discover available products.

Addressing these issues through improved vendor onboarding, structured category redesign, removal of inactive categories, and enhancement of search and filtering systems will significantly improve usability, strengthen marketplace reliability, and enhance overall user experience and platform scalability.

7. Services Analysis

A) Overview

The Services Analysis focused on healthcare, professional, educational, beauty, travel, and local consumer service categories available within the Hello platform. The analysis evaluated service organization, vendor availability, navigation flow, category structure, and user interaction systems across multiple service sections.

The testing identified that while the platform contains a large variety of services, multiple categories suffer from low vendor availability, unclear grouping structures, and inactive service pages. Several modern service-platform features such as booking systems, consultation workflows, verified profiles, ratings, reviews, and inquiry systems are currently limited or unavailable.

B) Service Vendor Availability Table

Service Category	Vendor Availability	Observation	Priority
Dentist	3 vendors	Only healthcare category with active vendors	Medium
Specialist Doctors	No vendors available	Most specialist healthcare sections are inactive	High
Auditor	Coming Soon	Service currently unavailable	High
Insurance	Limited functionality	Categories exist but interaction features are limited	Medium
Legal Services	Structured categories available	Lacks booking and consultation systems	Medium

C) Service Structure & UX Issues Table

Observation	Impact	Recommendation	Priority
Services are displayed separately instead of grouped categories	Navigation becomes cluttered and difficult	Group services into structured parent categories	High

Users discover unavailable services only after opening service pages	Causes frustration and unnecessary navigation	Display unavailable tags before entering categories	High
Similar healthcare categories create confusion	Users may struggle to identify correct service type	Rename categories based on actual functionality	Medium
Multiple services lack booking, consultation, or inquiry systems	Reduces user interaction and marketplace usability	Add booking, inquiry, and consultation features	High
Vendor verification and reviews are unavailable	Reduces trust and decision-making confidence	Add verified profiles and customer review systems	Medium

D) Competitor-Based Service Gaps

Feature	Hello	Competitor Platforms
Booking System	Limited	Available
Verified Profiles	No	Yes
Reviews & Ratings	Limited	Yes
Inquiry System	No	Yes
Consultation Workflow	Limited	Yes

E) Service Screenshots

F) Service Charts

Satus vs Count

Count vs Issue

G) Services Analysis Conclusion

The services marketplace demonstrates broad category coverage across healthcare, professional, legal, insurance, beauty, travel, and other local service domains, indicating strong potential for a multi-service platform. However, the current implementation lacks operational consistency, as many service categories either have limited vendor availability or are completely inactive, which creates gaps between listed services and actual usable offerings.

The analysis further highlights that several key interaction systems required for a complete service marketplace experience are missing or underdeveloped. These include booking functionality, consultation workflows, inquiry systems, verified vendor profiles, and detailed rating/review mechanisms. The absence of these features reduces trust, limits user engagement, and prevents smooth end-to-end service completion.

Additionally, service grouping and category structuring are not fully optimized, leading to fragmentation in navigation and difficulty in identifying relevant services efficiently. Users may encounter unclear category definitions or incomplete service sections, which negatively impacts usability and overall experience.

Addressing these issues through improved vendor onboarding, structured category consolidation, implementation of booking and consultation systems, and integration of trust-building features such as reviews and verification will significantly enhance platform reliability, user satisfaction, and long-term marketplace scalability and competitiveness.

8. Kandivali Location Testing

A) Overview

The Kandivali Location Testing was conducted to evaluate how the Hello platform performs when service availability is filtered based on a specific geographic location. The testing focused on healthcare service distribution, vendor variation across categories, and consistency of service availability compared to the general platform view.

The analysis identified slight improvements in vendor availability for certain categories such as Dentist Services; however, most specialist healthcare categories remained inactive or showed no vendors. Additionally, vendor distribution across locations was inconsistent, with some services appearing in one area while remaining unavailable in others.

B) Location-Based Service Findings Table

Service Category	Observation	Impact	Priority
Dentist Services	Vendor count increased from 2 to 3 after location change	Slight improvement in local availability	Medium
Specialist Doctors	Most categories remain empty	Users cannot access key healthcare services locally	High
Healthcare Categories	Inconsistent vendor distribution across locations	Uneven user experience across regions	High
Vendor Repetition	Same vendors appear across different locations	Reduced diversity in service options	Medium

C) Location-Based UX Issues

Observation	Impact	Recommendation	Priority
Service availability changes significantly by location	Inconsistent user experience	Standardize minimum service coverage per location	High
Limited improvement in specialist services even after location filtering	Core healthcare gaps remain unresolved	Increase specialist onboarding in all regions	High
No clear indication of location-based availability differences	Users may assume services are universally available	Add location-based availability labels	Medium

D) Key Insights

- Location filtering provides minor improvements only in basic categories (e.g., Dentist Services).
- Specialist healthcare services remain largely unavailable regardless of location.
- Vendor distribution is not balanced across geographic areas.
- The platform does not clearly communicate location-based service limitations to users.

E) Conclusion

The Kandivali Location Testing highlights that while minor improvements exist in select categories, overall service availability remains inconsistent across locations. Strengthening regional vendor onboarding and ensuring minimum service coverage per location will be essential to improve reliability and user trust in location-based service discovery.

9. Search & Navigation Analysis

A) Overview

The Search & Navigation Analysis evaluated the usability and efficiency of the Hello platform's search functionality and overall navigation flow across shopping and services sections. The assessment focused on how easily users can discover categories, locate services, and move between different sections of the application.

The analysis identified that while basic navigation structure exists, search visibility and efficiency are limited. Users often need multiple steps to reach relevant categories, and in some cases, empty or inactive pages are displayed after selection. These issues reduce discovery speed and negatively impact overall user experience.

B) Search & Navigation Findings Table

Observation	Impact	Recommendation	Priority
Search visibility is weak across major sections	Users struggle to quickly find relevant services/products	Improve search bar visibility and placement across all screens	High
Multiple clicks required to reach final service/product pages	Reduces usability and slows down user journey	Simplify navigation flow and reduce hierarchy depth	High
Empty or inactive pages appear after category selection	Leads to user frustration and drop-offs	Remove inactive pages or ensure minimum listings before display	High
Inconsistent category structure across sections	Creates confusion during browsing	Standardize category hierarchy across platform	Medium
Limited smart search (no strong suggestions or auto-complete)	Slower discovery of relevant content	Implement predictive search and auto-suggestions	High

C) Navigation Flow Issues

Observation	Impact	Recommendation	Priority
Users must navigate through multiple layers to access services	Inefficient browsing experience	Flatten navigation structure where possible	Medium

Some categories lead to dead-end or empty pages	Breaks user journey flow	Ensure all categories have active listings or placeholders	High
No clear differentiation between active and inactive sections	Users cannot identify usable content	Add visual indicators for active/inactive categories	High

D) Key UX Insights

- Search functionality exists but lacks strong visibility and optimization.
- Navigation flow is functional but not efficient for quick discovery.
- Empty pages significantly impact user trust and engagement.
- Category consistency is not fully maintained across shopping and services sections.
- Lack of smart search features reduces platform competitiveness.

E) Conclusion

The Search & Navigation system provides basic usability but requires significant improvements in visibility, structure, and efficiency. Enhancing search intelligence, reducing navigation depth, and eliminating inactive or empty pages will greatly improve user experience and platform usability.

10. Competitor Comparison

Feature	Hello	Amazon	Flipkart	Meesho
Search & Filters	Basic / Limited	Advanced	Advanced	Moderate
Ratings & Reviews	Limited	Strong	Strong	Strong
Product/Service Recommendations	Limited	Advanced AI-based	Advanced	Moderate
Local Services	Available but incomplete	Not available	Not available	Limited
Vendor Availability	Limited	Strong	Strong	Strong
Booking / Service Completion Flow	Not available / limited	Available (service-specific)	Available (select services)	Limited
UI/UX Design Quality	Basic	Highly optimized	Highly optimized	Simple but engaging
Service Marketplace Structure	Underdeveloped	Highly structured	Highly structured	Moderately structured

11. Screenshots & Visual Evidence

- Empty Healthcare Categories

- Coming Soon Page

- Insurance Section

- Legal Services Page

12. Data Tracking & Dashboard Analysis

A) Positive Findings

- Download tracking is properly maintained
- Registration tracking is consistent
- Screenshots and documentation are organized
- KPI structure is professionally arranged

B) Recommendations

- Implement Power BI dashboards for better visualization and decision-making
- Add automation and interactive filters for real-time insights
- Add category-wise and location-wise analytics for deeper analysis
- Reduce manual reporting workload through dashboard integration

C) Power BI Dashboard Implementation

The Power BI dashboard titled “*Hello App - Data Collection & Documentation Tracker*” displays key metrics such as total downloads, registrations, and feedback status over a 7-day period. It includes daily trend charts, completion rates, and recommendations for improving data collection efficiency.

The dashboard provides a structured view of user activity patterns and helps in identifying operational improvements in tracking and reporting. It enhances decision-making by converting manual data collection into a visual and interactive format.

13. Major Issues Identified

High Priority

- Empty categories across shopping and service sections
- Lack of effective filters for category-wise and product/service discovery
- Weak search visibility and limited search efficiency
- Limited vendor availability across multiple categories
- Poor healthcare coverage in specialist service categories
- Absence of complete ratings and pricing system for comparison and trust-building

Medium Priority

- UI spacing and layout consistency issues
- Missing trending or highlighted sections for user engagement
- Lack of clear vendor onboarding guidance and support flow
- Navigation complexity due to multiple category layers and inconsistent structure

Low Priority

- Minor category additions required for completeness
- UI visual enhancements to improve overall presentation and engagement.

14. Final Recommendations

Short-Term Improvements

- Improve search functionality and visibility across all sections
- Hide inactive or empty categories from user view
- Improve and standardize category structure
- Add advanced filters and well-defined subcategories
- Improve vendor onboarding process with clear guidance and steps

Long-Term Improvements

- Expand vendor acquisition across all major categories
- Improve healthcare service coverage, especially specialist categories
- Build and enhance Power BI dashboards for real-time analytics
- Add AI-based recommendation system for better user experience
- Improve personalization and product/service discovery mechanisms

15. Conclusion

The Hello application demonstrates strong potential as a multi-category marketplace integrating shopping and local services within a single platform. The system provides a structured interface and supports basic navigation across categories.

However, the analysis identified significant gaps in vendor availability, category completeness, search functionality, and filtering systems. Several service and product categories remain inactive or partially developed, which impacts overall usability and user trust.

Improving vendor onboarding, enhancing search and filter capabilities, and strengthening healthcare and service coverage will significantly improve platform performance and scalability.

Overall, with operational improvements and better category structuring, the platform can evolve into a more reliable and competitive marketplace system.
