

Week 4 – Final Findings Report (Verified Call Feedback Analysis)

Data Analytics Team – Hello App

Introduction

During Week 4, our team conducted response verification through direct user interaction to validate the feedback collected previously. Verification was completed using two response sheets that included previously collected responses and additional assigned responses.

Each team member contacted users from their own referral responses and recorded updated feedback. The objective was not only to confirm previous responses but also to understand actual app usage, identify changes in user opinion, collect improvement suggestions, and prepare more accurate findings for analysis.

The verification process included:

- Confirming whether users downloaded the Hello App
 - Checking if users were actively using the application
 - Comparing current feedback with Google Form responses
 - Recording reasons where feedback changed
 - Collecting improvement suggestions
 - Understanding awareness of Hello App features
-

Team Verification Summary

Response verification was completed by contacting assigned users and updating outcomes in the shared sheet.

Response distribution:

- Navodita – Verified 39 responses
- Insha – Verified 42 responses
- Aryan – Verified 21 responses
- Tanmay – Verified 20 responses
- Keshav – Verified 19 responses
- Anandan – Verified 11 responses
- Pankaj – Verified 6 responses

The verified data became the final source for identifying actual user behavior and expectations.

Key Findings

1. Strong Interest in the All-in-One App Concept

One of the strongest positive patterns found during calls was appreciation for the idea of combining multiple services into one platform.

Users frequently mentioned:

- Easy access to different services
- Convenience
- Reduced dependency on multiple applications
- Time saving

Many users appreciated categories such as shopping, entertainment, services, and daily-use sections existing together.

2. Vendor Availability Was the Most Common Concern

Although users liked the concept, limited vendor availability appeared repeatedly across responses.

Common concerns:

- Limited vendors in shopping sections
- Some categories appearing inactive
- Missing providers in service categories
- Limited local service availability

Users expected:

- More active vendors
- Better category population
- Improved service availability

This became the most repeated improvement request.

3. User Feedback Changed After Actual Usage

Call verification showed differences between initial impressions and actual usage.

Observed patterns:

- Users initially rated based on appearance
- Later feedback focused more on usability
- Expectations increased after exploring categories

Common reasons for feedback changes:

- Services unavailable
- Vendors missing
- Content limitations
- Navigation expectations

This showed why verification calls were necessary.

4. UI and Navigation Were Appreciated but Need Improvements

Users generally responded positively to:

- Clean design
- Easy navigation
- Organized categories
- Attractive interface

However, recommendations included:

- Faster loading
- Better onboarding
- Improved visual hierarchy
- Smoother navigation
- More intuitive user flow

Some users requested:

- Dark mode
 - Better search visibility
 - Improved sponsored content identification
-

5. Content and Category Expansion Is Required

Several users mentioned that categories felt incomplete.

Examples included:

- Limited entertainment content
- Fewer songs and media options
- Missing education-related services
- Missing specialized service categories

Requested additions:

- Educational platforms
 - Child-focused services
 - Daily-use products
 - Expanded entertainment content
-

6. Engagement and Retention Need Improvement

Some users downloaded the app but were no longer active.

Reasons identified:

- Already comfortable with existing applications
- Did not fully explore features
- No strong reason to return
- Missing engagement mechanisms

Suggestions:

- Promotional offers
 - Better onboarding
 - Retention features
 - More personalized recommendations
-

7. Search and Discovery Experience Can Improve

Users also highlighted:

- Need for better product visibility
- Faster discovery of categories
- More filters
- Better recommendations

Additional suggestions:

- Multiple product images
 - Clear category organization
 - Better search experience
-

Overall Recommendations

Based on verified user feedback, our team recommends:

Short-Term Improvements

- Increase vendor onboarding
- Improve loading performance
- Improve onboarding experience
- Add more category content

Medium-Term Improvements

- Expand entertainment and education sections
- Improve service availability
- Introduce better search and filtering

Long-Term Improvements

- Build stronger engagement features
 - Improve retention strategies
 - Continue collecting verified user feedback
-

Conclusion

Week 4 verification helped convert raw responses into validated user insights. Direct interaction with users gave a clearer understanding of actual usage patterns and expectations.

The Hello App received positive feedback for its concept, UI, and service integration. However, users also highlighted improvement areas including vendor availability, category expansion, content depth, navigation quality, and engagement.

These findings can support future improvements and help make the platform more useful and user-focused.
